# InfTable

ver. 1.0

InfTable is an application which brings the University of Edinburgh Informatics lectures timetable to android mobile phones. It allows users to browse all courses in School of Informatics, select the courses you are interested in (taking) and see the timetable. The application needs internet connection when first run to download the information about the courses, timetable and venues. URLs to the three xml files containing this information should be provided by the user if their location changes. In case of no internet connection, wrong URL or wrong xml structure the user is notified about the error and won't be able to proceed until he/she fixes the problem. Once a successful download the user can add his/her courses to 'My courses' and see his/her weekly timetable. The application would automatically bring up the timetable for the current semester and day if the timetable is opened.

How to run the application

The application can be loaded in Eclipse from File -> New -> Other -> Android -> Android Project from Existing Code and then run on a virtual or physical device connected to adb.
